

SEE. UNDERSTAND. RESPOND.

AJNAT SOC

From scattered signals
to coordinated security action.

Endpoint visibility, event correlation and
incident response in one analyst workspace.

SIEM + EDR

INVESTIGATION

RESPONSE

Security signals are everywhere. The complete picture is harder to find.

Endpoint alerts, network events and web logs arrive in separate streams.
Analysts spend time connecting evidence before they can decide what to do.

THE FRAGMENTED WORKFLOW

Blind spots

Disconnected evidence hides how an attack develops.

Alert fatigue

Repeated signals compete for the same analyst attention.

Response friction

Manual handoffs slow containment and follow-up.

One workflow. From telemetry to response.

Collect the signals, connect the evidence and give analysts a clear path to action.

01 Collect

Bring endpoint, network, web and authentication events into one view.

02 Correlate

Connect related activity and enrich it with threat intelligence.

03 Investigate

Review severity, timelines and evidence before confirming an incident.

04 Respond

Assign an owner, run supported actions and keep an audit trail.

FROM RAW EVENTS TO DECISIONS

01

BRING THE SIGNALS TOGETHER

See your security environment clearly.

Give analysts a shared view of assets, alerts and events across the sources your organization connects.

- ✓ Process, file and authentication activity
- ✓ Network, DNS and web security signals
- ✓ Company-scoped views and role-based access

ILLUSTRATIVE CONSOLE • SAMPLE EVENTS

02

CONNECT THE EVIDENCE

Understand what deserves attention.

Correlate related events, add threat intelligence and trace the activity behind an alert.

- ✓ Filter by severity, status and organization
- ✓ Review indicators and the event timeline
- ✓ Use AI summaries where configured

AJNAT SOC / CORRELATED INVESTIGATION

HIGH

UNDER REVIEW

Possible account compromise

Example case / host: FIN-WS-014 / identity: user01

- Repeated failed logins**
Authentication activity linked to the same account.
- Unusual process execution**
A related endpoint event adds investigation context.
- Outbound connection observed**
Destination can be checked against threat indicators.

CONTEXT

- Identity**
Shared account
- Asset**
Related endpoint
- Intelligence**
Indicator lookup

03

ACT WITH CONTROL

Move from an alert to a managed incident.

Assign responsibility, coordinate containment and retain the evidence behind every response decision.

- ✓ Assign incident owners and priorities
- ✓ Apply approval rules to response actions
- ✓ Track execution and export reports

SUPPORTED ACTIONS DEPEND ON PERMISSIONS AND INTEGRATIONS

A connected workflow. A clearer path to action.

Bring visibility, investigation and response into the same operational context.

Fragmented operations

Separate views for assets and events

Manual reconstruction of related activity

Threat indicators checked in separate tools

Response decisions spread across handoffs

With AJNAT SOC

Shared visibility across connected sources

Correlated events with investigation context

Threat intelligence alongside relevant evidence

Owned incidents, response records and reports

VISIBILITY

Know what is happening

CONTEXT

Understand what matters

CONTROL

Choose the next action

See AJNAT SOC in your environment.

Build the conversation around your assets, your security priorities and the incidents your team needs to handle.

01

Define your coverage

Choose critical assets, event sources and access roles.

02

Walk through an incident

Follow a signal from detection to investigation and response.

03

Plan the deployment

Confirm integrations, agent permissions and pilot scope.
